Outline

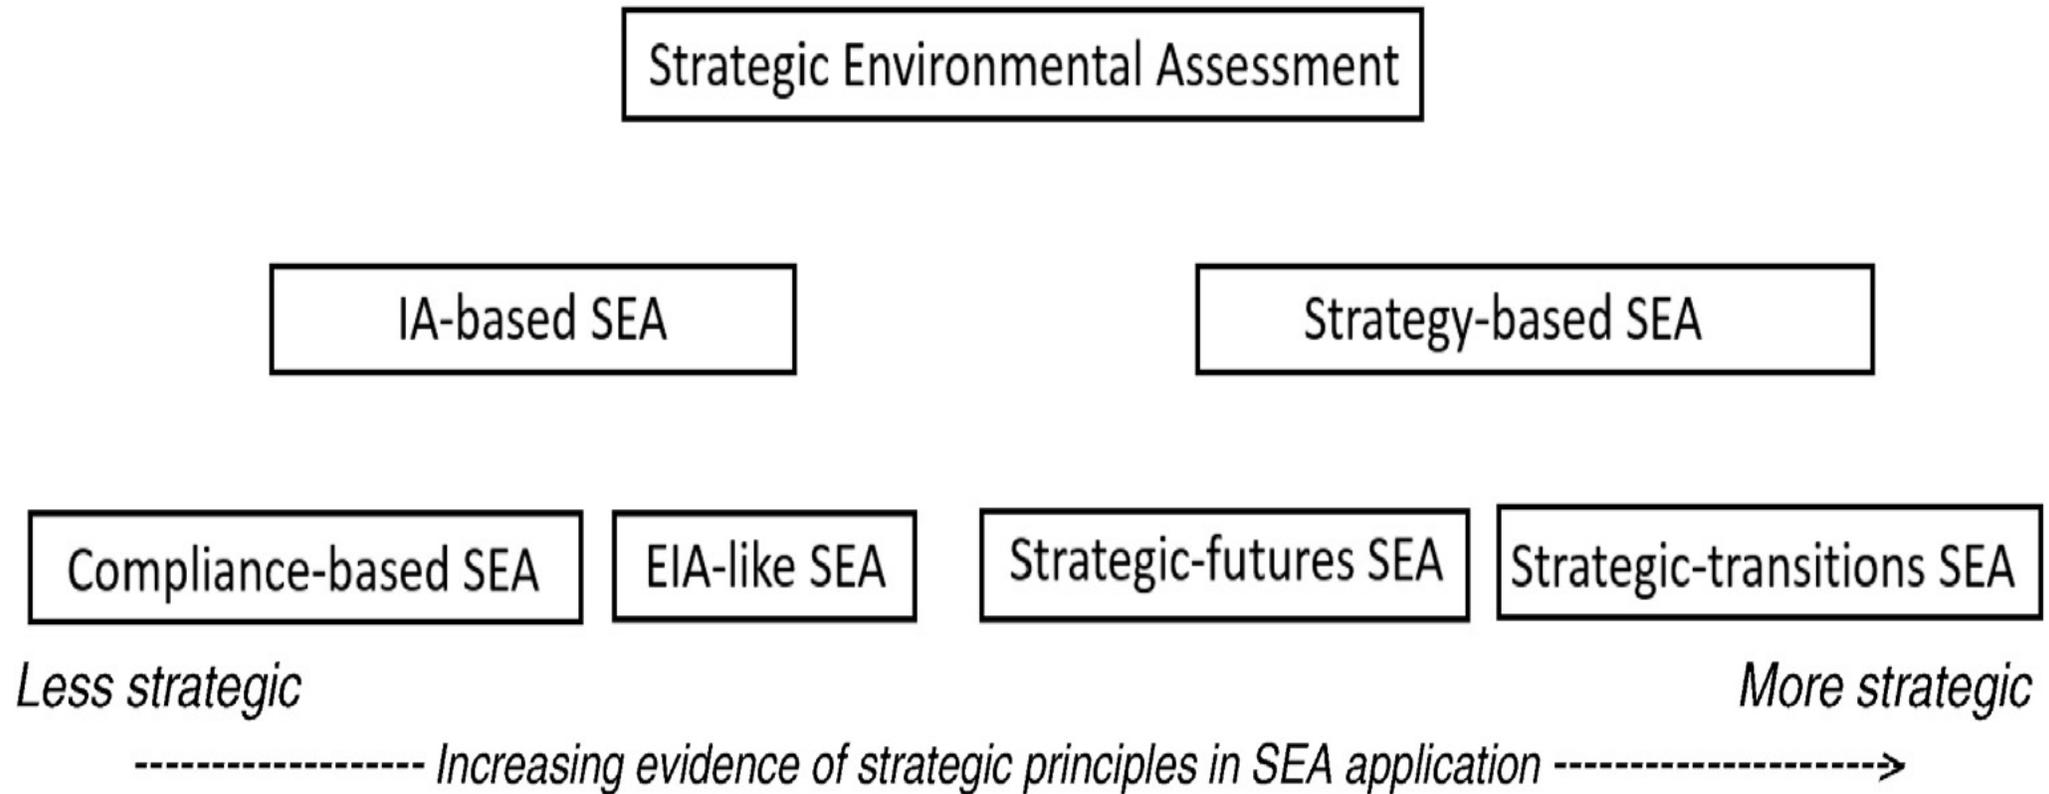

Conceptualizing SEA

**The Need for Strategic
Transitions SEA**

**Existing Strategy-
Based SEA Models**

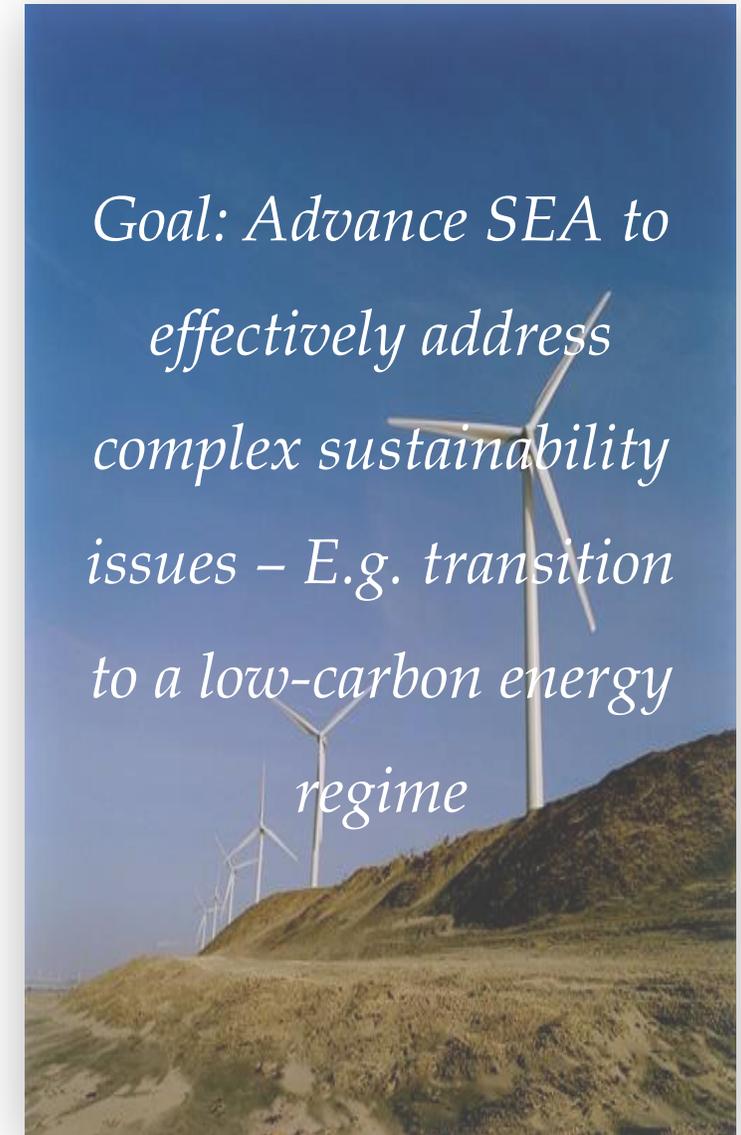

**The Transitions-Based
Framework**

Conceptualizing Strategic Environmental Assessment

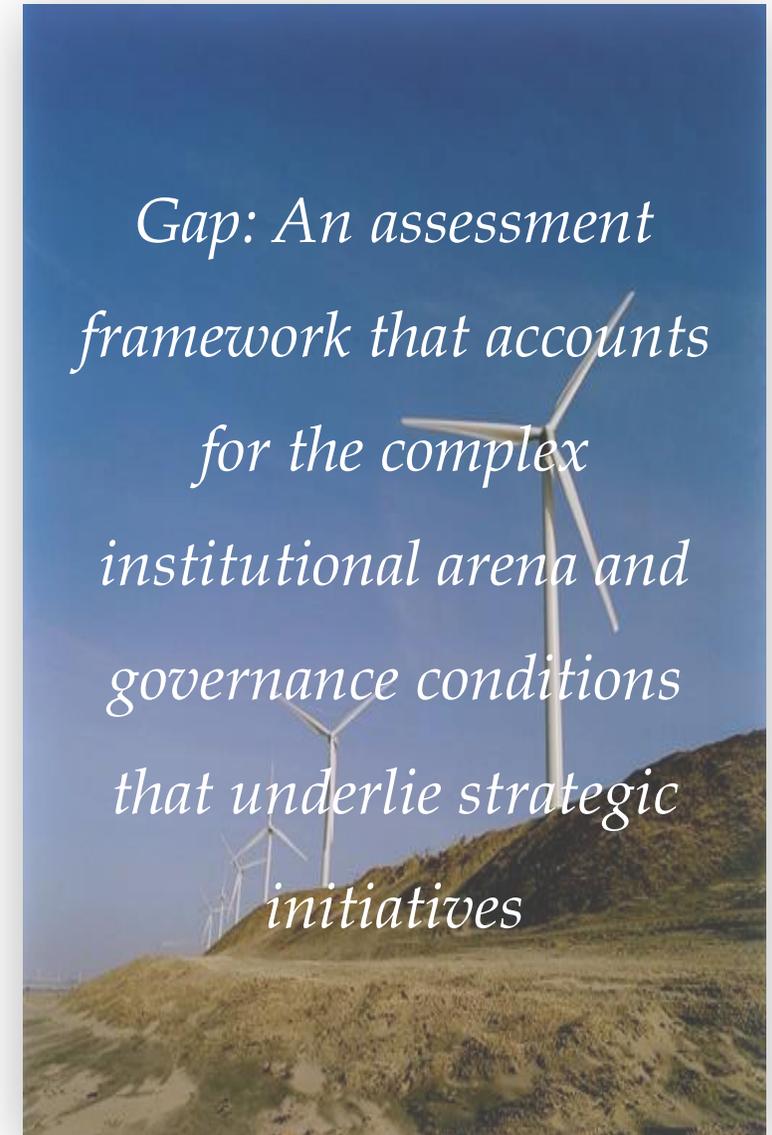

The Need for Strategic Transitions SEA

- How can SEA enable fundamental policy shifts within complex socio-technical systems and what are the obstacles to enabling such transitions?
- What capacities exist, or innovations are required, in institutional and policy environments to facilitate sustainability transitions?
- Where are the windows of opportunity to influence strategic decision-making?

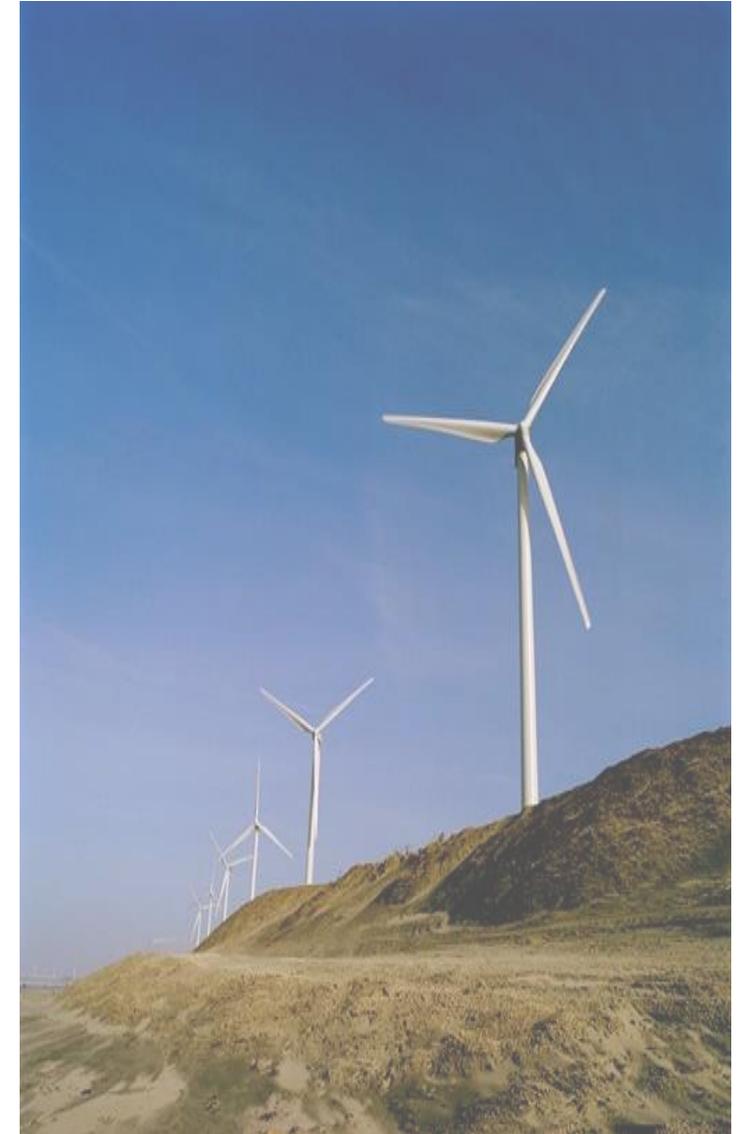

The Need for Strategic Transitions SEA

- Conceptualizing SEA as a tool to enable sustainability transitions requires clearer articulation of the co-evolving, complex relationship between key elements and characteristics of transition
- The traditional IA-based SEA model needs to be complemented with more strategy-based approaches

The Need for Strategic Transitions SEA

- Key insights can be gained from the socio-technical transitions literature
- The study draws on the theoretical underpinnings of these frameworks:
 - Multi-level perspective – multi-level framing to understand change processes influencing development trajectories
 - Transition governance – deliberative governance approach and long-term perspective in managing transition pathways

Existing Strategy-Based SEA Models

Model	Strategic Elements	Theoretical Background
Strategic-Thinking SEA Model	<ul style="list-style-type: none">• Critical decisions factors (CDF)• Strategic Reference Framework (SRF)• Institutional & Governance Framework• Strategic Options/ Alternatives• Opportunities and Risks• Decision Windows• Stakeholder Engagement/Continuous Dialogue• Follow-up	<ul style="list-style-type: none">• Complex systems thinking• Good governance

Existing Strategy-Based SEA Models

Model	Strategic Elements	Theoretical Background
Institution-Centered SEA Model	<ul style="list-style-type: none">• Policy Formation/Implementation• Windows of Opportunity• Environmental Priority Setting• Institutional Assessment• Stakeholder Representation• Social Accountability	<ul style="list-style-type: none">• Policy analysis• Political theory• Organizational learning/ Capacity building

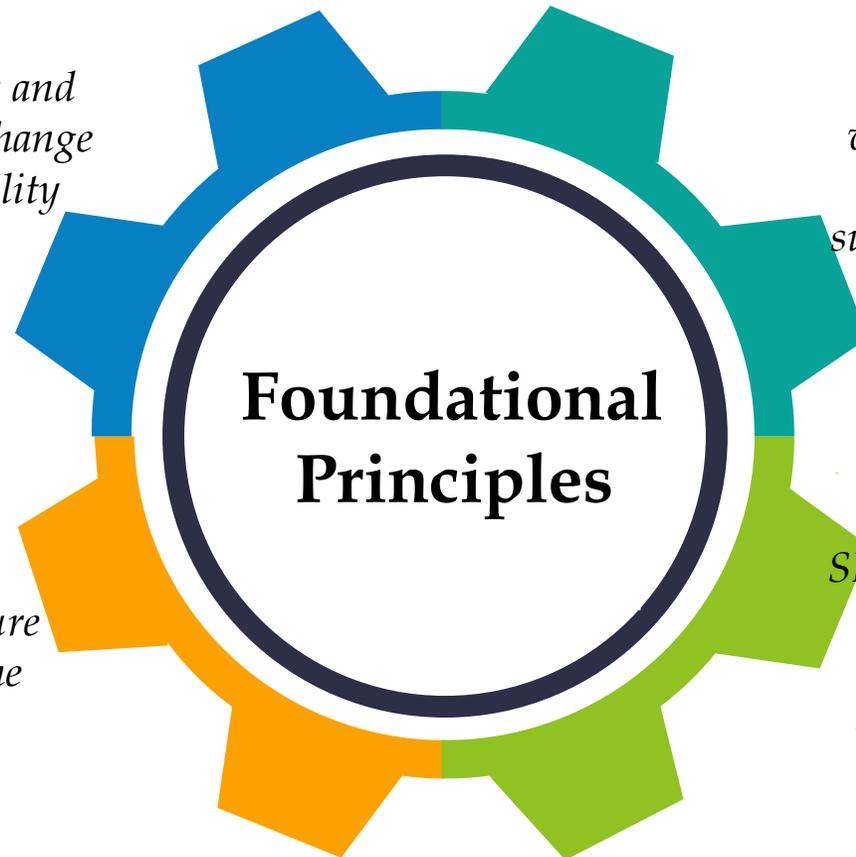

Transitions-Based SEA Framework

Guiding vision:

Crucial to understanding the decision-context and establishing enabling conditions for strategic change is identifying a coherent vision for sustainability transformations

Dynamic processes and complex interactions:

SEA must fully acknowledge the dynamic nature of sustainability decision-making as well as the complex interlinkages of multiple actors and domains across multiple scales

Foundational Principles

Institution-centered:

SEA should assess the gaps, strengths and weaknesses, opportunities and constraints within existing institutional arrangements needed to support proposed transitions from one development trajectory to another

Politically-oriented:

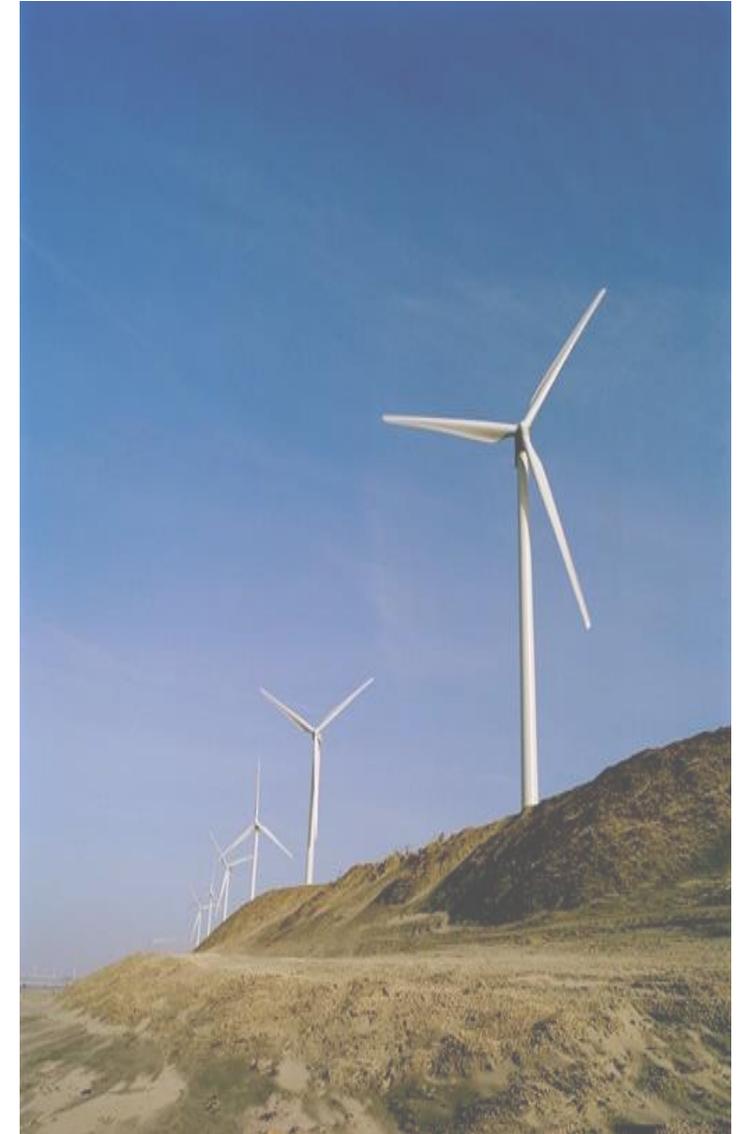

SEA must assess the capacity of the existing political environment to support sustainability transformations including the political circumstances under which sustainability policies are likely to be adopted

Relationship between actors:

SEA can serve, not only to engage the perspective of relevant actors in a fair and open process, but also to explore their dynamic interaction, needs, and capacities

Transitions-Based SEA Framework

- Building blocks of the Transitions-based SEA framework
 - Key elements
 - Types of questions to explore
- To provide context, the framework is situated within the energy resource sector - specifically renewable energy transition in Saskatchewan, Canada
- The province has set a goal to increase renewable electricity generation capacity from 25% of the current mix up to 50% by 2030

Transitions-Based SEA Framework

Guiding vision and drivers of transitions

- What are the drivers and selective pressures for change?*

- Is the guiding vision coherent and does it adopt a long term perspective to guide desired transition pathways?*

Transitions-Based SEA Framework

Institutional and Governance Context:

-Is there adequate capacity within existing institutions and governance arrangements to support desired transitions and what new capacity or institutional mechanisms are needed to ensure successful sustainability transition?

-What are the current institutional barriers to achieving the desired strategic change?

•-Institutions

*•-Policy and
Regulatory
Context*

-Political Context

*-Actor/stakeholder
relations*

Transitions-Based SEA Framework

Opportunities and Risks of Sustainability Pathways

•-*What are the implications of adopting certain energy development trajectories?*

•-*What are the immediate and longer-term risks and benefits of proposed energy transitions?*

Transitions-Based SEA Framework

Progress Indicators for On-going Transition Management

- *-What are the progress indicators useful to track the transition and help ensure transition goals, and impact management strategies are being achieved?*

Transitions-Based SEA Framework

Exogenous Landscape Influences

- *-What are the impacts of the broader landscape changes on the proposed energy transition?*

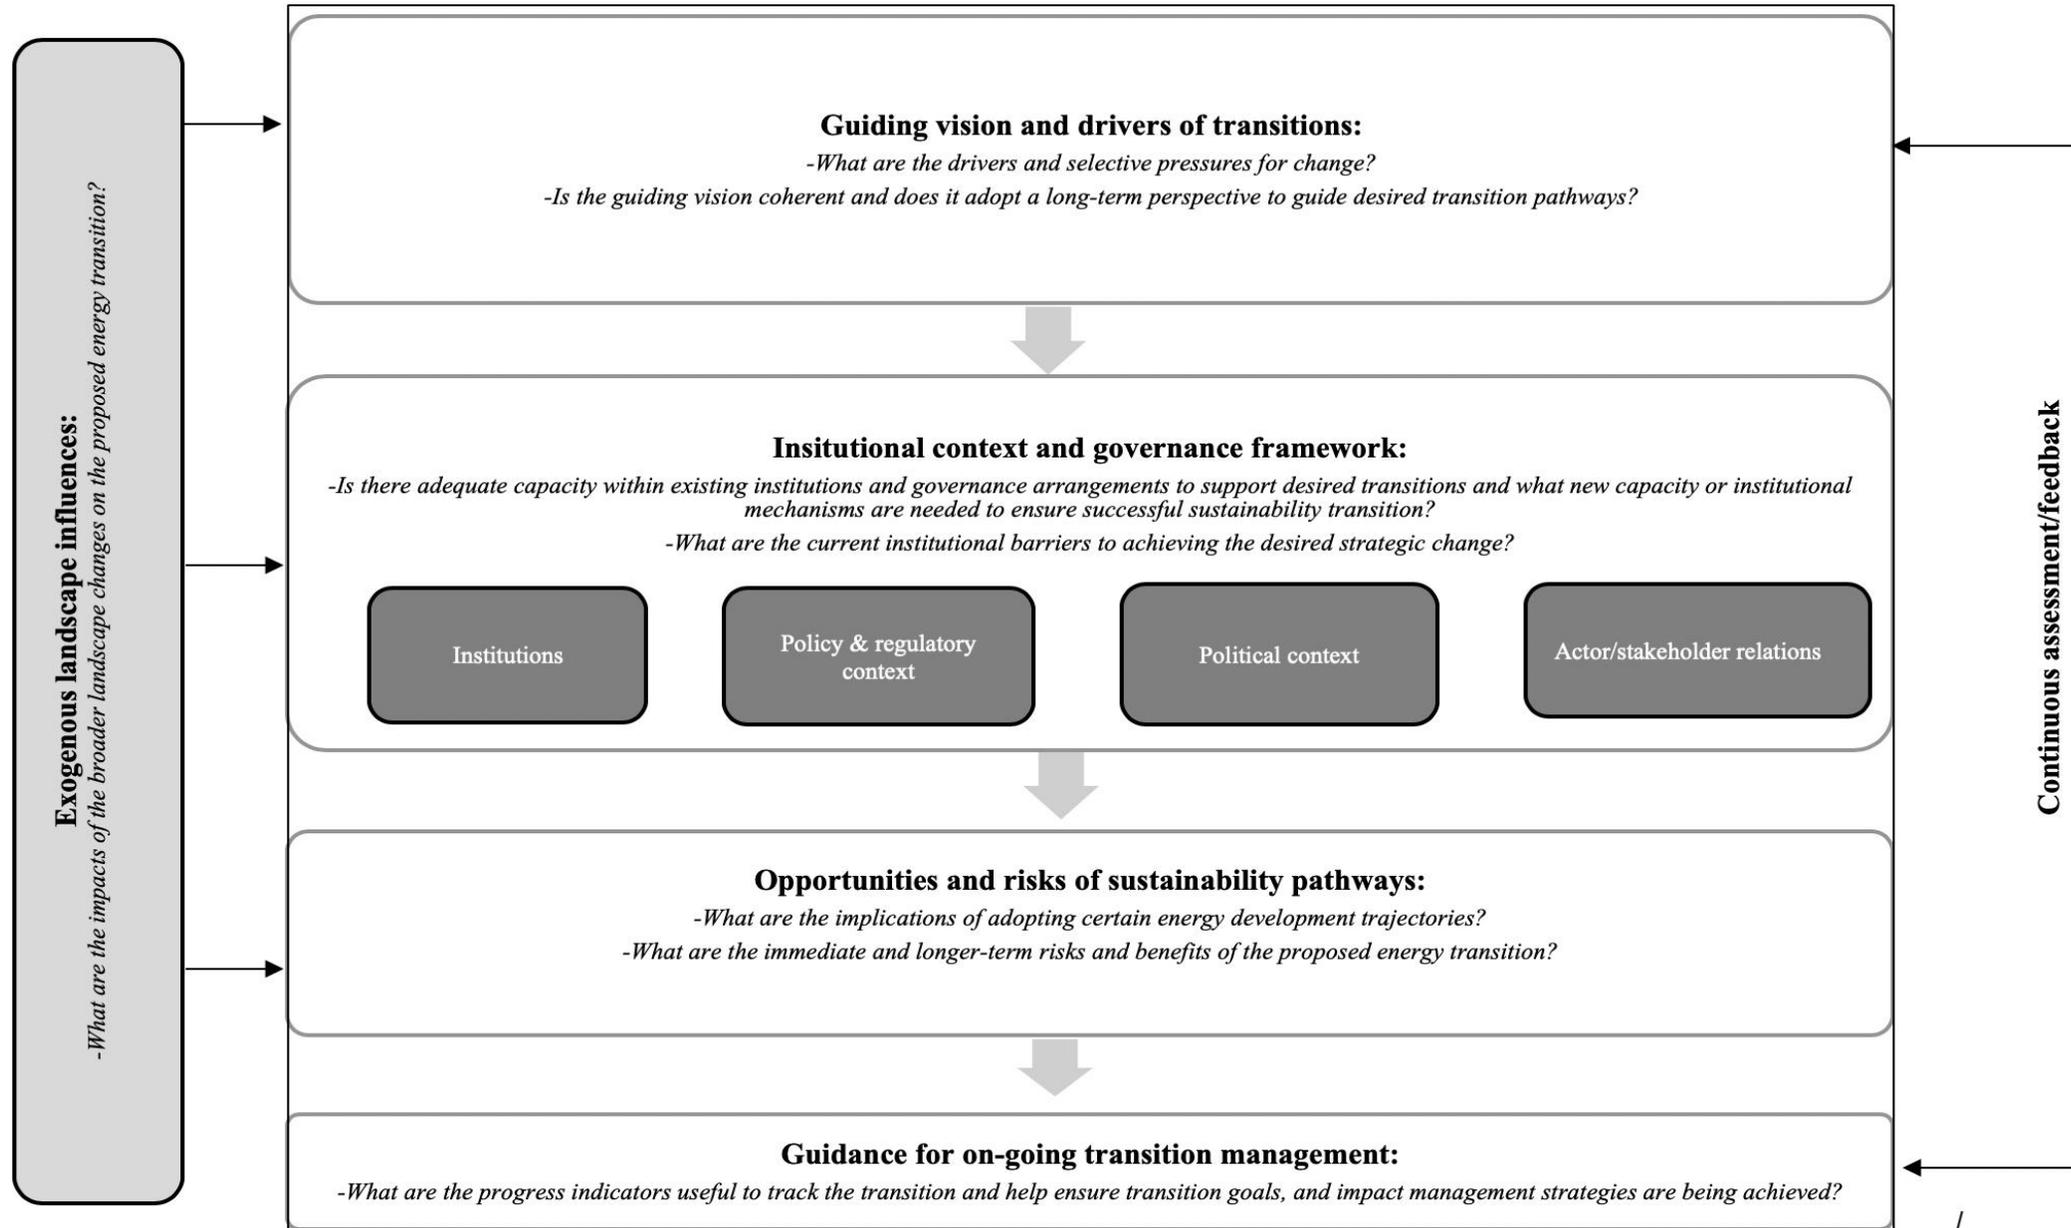

Figure 1: Conceptual Framework of Transitions-Based SEA

Conclusion

- Advancing strategy-based SEA approaches has become increasingly important in response to more calls to enhance SEA's effectiveness as a strategic decision-making tool
- Current EA practices need more robust frameworks that can effectively address the recurring institutional and governance problems that currently impede successful sustainability transitions
- For future research, there is a need for an empirical application of the strategic-transitions model to an energy case study to test the value and merits of applying the framework in practice
